

SUMMER INTERNSHIP - 2026

AI Agents for Digital Capability Building in Tata Steel

WEEK-3

Build AI Core (Agentic + Practical Integration)

Under The Guidance of:
Mr. Abhinav Anish

Submitted By: Vaibhav Kumar

Objective:

Build a basic AI agent capable of answering Learning & Development queries using organizational knowledge.

What is Agentic AI?

In Traditional chatbots the response is fetched by using a LLM layer in between the user query and response generated.

But the model cannot answer company related queries as it's not trained on the company specific data.

The model only uses model knowledge used during training.

While in Agentic AI

The user submits a query.

The agent analyses the query and decides which tool or knowledge source is required.

The relevant information is retrieved from company documents, databases, or other tools.

The retrieved information is provided to the LLM as context.

The LLM generates a response grounded in company-specific data.

The Demo Architecture

How It Works:

User submits a query: Example: *"What happens during the first 90 days?"*

AI Agent analyses the query

The query is converted to lowercase.

The agent checks for keywords and phrases.

Tool Selection

If the query contains keywords like:

skills ,data analyst ,software engineer ,ai engineer

→ Agent selects **Skills Database Tool**

If the query contains keywords like:

onboarding ,salary ,benefits ,leave ,training ,90 days

→ Agent selects **Onboarding Document Tool**

Information Retrieval

Selected tool fetches relevant information from the CSV or onboarding document.

Context Generation

Retrieved information is combined with the user's question.

LLM Processing

Groq LLM uses the retrieved context to generate a relevant response.

Response Returned

Final answer is displayed to the user.

🤖 L&D AI Agent

Ask questions about skills, learning paths, or training documents.

Enter your question:

What benefits are available to employees?

Ask

Response

According to the document, the following benefits are available to employees:

1. Provident Fund: 12% employer contribution (matching employee contribution)
2. Health Insurance (Mediclaime): Self + family covered up to specified sum insured
3. Group Personal Accident Insurance: 24x7 coverage
4. Gratuity: After 5 years of continuous service
5. Annual Bonus: Based on company and individual performance
6. Canteen Subsidy: 50% subsidized meals at plant canteens
7. Transport: Company bus service for plant locations
8. Children Education Assistance: Up to Rs 10,000/year per child (max 2 children)
9. Employee Assistance Program: Confidential counseling services
10. Tata Steel Cooperative Credit Society: Optional membership for savings/loans

L&D AI Agent

Ask questions about skills, learning paths, or training documents.

Enter your question:

tell me key contacts

Ask

Response

Here are the key contacts mentioned in the document:

Department	Contact	Extension
HR Department	hr@tatasteel.com	201
IT Helpdesk	it@tatasteel.com	401
L&D Department	ld@tatasteel.com	202
Safety Officer	safety@tatasteel.com	203
Finance/Payroll	finance@tatasteel.com	501
Security	security@tatasteel.com	207
Your Manager	(provided separately)	-

🗣️ L&D AI Agent

Ask questions about skills, learning paths, or training documents.

Enter your question:

skills needed to become AI Engineer

Ask

Response

Introduction to AI Engineering

As an aspiring AI Engineer, you've already taken the first step by acquiring skills in Python, Machine Learning, Deep Learning, and Large Language Models (LLMs). To further develop your expertise and become a proficient AI Engineer, let's break down each skill and suggest a learning path:

1. Python

Python is a fundamental programming language in AI and Data Science. It's widely used for:

- Data manipulation and analysis
- Machine Learning model implementation
- Deep Learning framework integration
- Scripting and automation

Recommended Resources:

- Online courses: Python for Everybody (Coursera), Python Data Structures (Coursera)
- Books: "Python Crash Course" by Eric Matthes, "Automate the Boring Stuff with Python" by Al Sweigart
- Practice platforms: LeetCode, HackerRank, Python Challenge

2. Machine Learning (ML)

Machine Learning is a subset of AI that enables systems to learn from data without being explicitly programmed. Key concepts include:

Drawbacks

There is a keyword dependency in this architecture:

Eg: When eill I get my first salary will be answered as “salary” will match.

When will I get paid first – this will fall back and make the default LLM run and give a general answer.

This results in poor scalability and limits the user to suing very specific words which is very unlikely.

The fix:

Replace keyword matching with an LLM-based router or semantic similarity-based tool selection for better scalability and accuracy.
